Say again? The curious case of IoT interoperability.

An MSc Research Project

Tutor's Feedback

Thank you for your submission of a research outline for formative feedback. This was a good attempt and I think you manage to offer a good draft of the outline. Just a few points you want to keep in mind.

1) The research objectives are actually how you break down your RQs into workable bits in order to answer them. They're NOT methodological statements. Say you will define an ML model and/or present findings only say "HOW" you will do it. Here, you need to talk about WHAT.

2) The "methodology" should provide more details on the study design in terms of the kind of methods and justification for their choices.

3) Another important point is that the proposal should include a section where you explain how the project meets the requirement of your MSc major – this should come at the beginning.

4) Remember to pay attention to the visuals in your presentation --including charts and tables whenever possible.

5) A Gantt Chart is also a good way to synthesise your planning in a neat and exhaustive way.

Make sure to take good note of these points for your research outline.
